4.2 Functions

# 4.2 Functions

Use the rotary switch to switch the device on (desired measuring function) or off ("OFF"). The device confirms each operation of keys with an acoustic signal.

#### Smart automatic switch-off (APO, Auto-Power-Off)

The device switches off automatically after approx. 32 minutes. To switch the device back on, press the "HOLD" or "VoltSense" key or first set the rotary switch to switch position "OFF" and then set the desired measuring function.

If one of the following conditions is fulfilled, there will be no automatic switch-off:

- The rotary switch or a key is operated.
- The displayed value is >8.5 % of the final measuring range value.
- "OL" is not displayed during resistance measurement, continuity or diode test.
- No zero value is displayed during frequency measurement.
- An alternating field is detected during the "voltage indicator" measuring function.

### 4.2.1 "SELECT" key

#### Selecting a function

Press the "SELECT" key to select the second or third function of the respective rotary switch position.

The last selected function will be stored for each rotary switch position and automatically preselected when setting the function again and after switching the device on again.

Table 4: Selecting a function

#### **Display illumination**

Press the "SELECT" key (>1 second) to switch on the background lighting of the digital display. After approx. 10 minutes, the background lighting is automatically switched off again. Alternatively, press the "SELECT" key (>1 second) to switch off the background lighting manually.

### 4.2.2 "RANGE" key

#### "Measuring range" function

Press the "RANGE" key to disable the automatic measuring range selection (AUTO) and set the measuring range manually. Press the "RANGE" key (>1 second) to enable the automatic measuring range selection afterwards (the "AUTO" symbol will be displayed).

The manual measuring range selection is not available for the following functions:

- · Capacitance measurement
- Frequency measurement

#### "Trigger threshold" function

Press the "RANGE" ("LEVEL") key to set the trigger threshold of a different voltage range for the frequency measurement in the V-AC or V-DC measuring function.

### 4.2.3 "MIN MAX" key

#### "MIN MAX" function

The "MIN MAX" function automatically records the lowest and highest measured value as well as the average value of a measurement series.

Press the "MIN MAX" key to enable the "MIN MAX" function. With the function being enabled, the "MMA" symbol is shown on the digital display. Press the "MIN MAX" key (>1 second) to disable the "MIN MAX" function afterwards.

The device confirms each detection of a new maximum or minimum value with a brief acoustic signal. Press the "MIN MAX" key to toggle between the display of the maximum (MAX), minimum (MIN), average (AVG) and currently measured value (MAX AVG MIN).

If the "MIN MAX" function is enabled, the automatic switch-off (APO, Auto-Power-Off) is disabled.

#### 4.2.4 "HOLD" key

The "HOLD" key has two functions.

#### "HOLD" function

The "HOLD" function is intended for holding the currently measured value.

Press the "HOLD" key to hold the currently measured value and the "HOLD" symbol is shown on the digital display. Press the "HOLD" key again to discard the held measured value and the currently measured value will be displayed again. 4.2 Functions

#### "Relative value" function

The "Relative value" function is intended for storing the currently displayed measured value when the function is enabled. Afterwards, until the function is disabled, the difference (offset) between the stored measured value and the following measured values is shown on the digital display.

Press the "HOLD" key (>1 second) to enable or disable the "Relative value" function. With the function being enabled, the " $\Delta$ " symbol is shown on the digital display.

### 4.2.5 "VoltSense" key

#### "Voltage indicator" function

The "Voltage indicator" function is intended for non-contact localisation of AC voltages to earth.

Press the "VoltSense" key to enable the "Voltage indicator" function and set the sensitivity of the function using the "RANGE" key. Press the "VoltSense" key again to disable the function afterwards.

### 4.2.6 "Hz" key

#### "Hz" function

The "Hz" function is intended for measuring the mains frequency.

Press the "Hz" key to enable the "Hz" function. With the function being enabled, the "Hz" symbol is shown on the digital display. Press the "Hz" key again to disable the function afterwards.

The device determines the frequency of a voltage or a current signal by counting how many times per second the signal exceeds a certain threshold (level). When the "Hz" function is enabled, the input sensitivity adjusts automatically depending on the measuring function used. The 6 V range has the highest sensitivity and the 1 000 V range the lowest.

In the V-AC and V-DC measuring functions, after pressing the "Hz" key, the voltage range with the associated trigger threshold is shown shortly before the frequency measurement. Press the "RANGE" key to set the trigger threshold of another voltage range.

It is recommended to measure the measuring signal (voltage or current) in the automatic measuring range selection (AUTO) first so that the trigger threshold is set automatically, and only then to enable the "Hz" function. If the measured value is not stable, use a lower sensitivity to suppress interference. If the measured value is 0 Hz, use a higher sensitivity.

# 4.2.7 Jack control (MM 2-2 / MM 2-3)

The device is provided with a visual and acoustic jack control. If a rotary switch position is set that is not admissible for the "A" jack (e. g. voltage measurement) and a safety measuring line is plugged into this socket, an acoustic signal will be emitted and the "InEr" ('Input error') will be shown on the digital display to protect the device.

A non-functioning visual and acoustic jack control indicates a defective fuse.

# 4.3 Measuring ranges

The device is provided with an automatic and a manual switch-over of the measuring range.

If a measured value is outside the measuring range, this is indicated by "0L" or "-0L". Please note that there will be no indication and warning in case of overload.

#### Measuring accuracy

The measuring accuracy is specified as the sum of the following:

- · Relative part of the measured value
- Number of digits (counting steps of the last digit)

The specified measuring accuracy applies at a temperature of 23  $^{\circ}$ C ±5  $^{\circ}$ C and a relative air humidity lower than 75 %. In case of deviating temperatures, observe the temperature coefficient by adding the following value to the specified measuring accuracy:

0.15 [1/°C] x specified measuring accuracy x difference to reference temperature range [°C] (at -10 ... 18 °C or 28 ... 45 °C or specified otherwise)

#### Additional specifications for AC functions

The measured value is obtained and displayed as a true r.m.s. value (TRUE RMS). For nonsinusoidal curves, the accuracy of the displayed value decreases.

Maximum crest factor of the measuring signal:

- For 50 % of the final measuring range value: 4,1
- For 100 % of the final measuring range value: 2,1
- Square-wave signals are not specified.
